

Project Specification: AI-Powered Recruitment & Screening Chatbot

1. Project Overview

The goal is to develop an **AI Recruitment Chatbot** integrated into a **WordPress** website. The bot will act as a first-level recruiter: screening CVs, conducting dynamic interviews based on job requirements, and shortlisting the top candidates for human review.

2. Chatbot Interface & Design (UI/UX)

The developer must build a custom, modern chat interface with the following features:

- **Floating Widget:** A "Chat Bubble" icon at the bottom right of the WordPress site that opens the chat window.
 - **User-Friendly Input:** A text input area with a dedicated **"Upload CV" (Paperclip icon)** button.
 - **Real-time Typing Indicators:** Visual cues (like "Bot is typing...") to make the conversation feel natural.
 - **Responsive Design:** The interface must work perfectly on both Desktop and Mobile browsers.
 - **Custom Branding:** Ability to change colors and the Bot's avatar to match the website's theme.
-

3. WordPress Integration Method

To add this chatbot to the WordPress site, the developer should use one of the following methods:

- **Option A (Shortcode/Plugin):** Develop a custom WordPress plugin that allows the admin to place the chatbot on any page using a `[recruiter-bot]` shortcode.
- **Option B (JavaScript Snippet):** Provide a lightweight `<script>` tag (similar to Tawk.to or Intercom) that can be inserted into the `header.php` or `footer.php` of the WordPress theme.

- **Backend Communication:** The frontend (WordPress) must communicate with the AI logic (Python/Node.js) via a secure **REST API**.
-

4. Core Functional Workflow

1. **Job Profile Setup:** Admin defines the Job Description (JD) in the backend.
 2. **CV Upload & Parsing:** Candidate uploads a PDF/Docx. The AI extracts text and checks for core skills.
 3. **Initial Qualification:** * *If qualified:* Proceed to interview.
 - *If not:* "Thank you, but your profile doesn't match our current requirements."
 4. **Dynamic Conversational Interview:** The bot asks 5–8 contextual questions. If a user gives a short answer, the bot should ask: *"Could you elaborate more on your role in that project?"*
 5. **Shortlisting:** After the chat, the AI ranks the candidate based on their answers and CV.
-

5. Admin Dashboard (Recruiter View)

A secure area within WordPress where the recruiter can see:

- **Candidate Table:** Name, Score (e.g., 85/100), and Status.
- **Interview Transcript:** Full log of the conversation.
- **Top Picks:** A highlighted section showing the **Top 3 to 5 Candidates** recommended by the AI.
